**Amendment to the Specification**

Please amend the application by adding new paragraph 0062a to the specification as follows:

[0062a] Figures 7 and 8, for example, show a preferred bowl shape for the flexible material of the valve 42. Figures 8(d) and 8(e) show the valve before and after it inverts, with Figure 8(d) showing the valve assembly not in use, with no negative pressure applied, and with Figure 8(e) showing the valve assembly in use, with negative pressure applied to the valve. As shown therein, upon application of negative pressure the bottom (distal side) of the bowl and the opening in that bottom move away from the blocking element, toward the top (proximal side) and rim of the bowl, and toward the spout, allowing liquid to exit through the opening.
